Powering Data Centers

On-site power you can count on.

reliable.
modular.
carbon-smart.

AI growth is outpacing the grid.

Data centers now require on-site power that does not depend on grid expansion.

KBR's fuel cell modules provide on-site power, supporting both initial deployment and long-term campus scaling.

5 to **50** MW

uninterrupted power through fuel cells.

Delivered by the market leader in modular energy solutions

On-site **Power**

Meeting compute demand beyond the limits of the grid

With billions of dollars in investment in AI infrastructure and widening gap between compute demand and available grid capacity, reliable onsite power has become key for operators.

Data centers operate millions of servers 24x7 to support foundation models and large-scale machine learning workloads. The primary constraint is no longer compute hardware – **it is the speed at which uninterrupted power can be brought online.**

Because the capital investment in AI data-center infrastructure far exceeds the cost of power systems, bringing a site into operation even 12–24 months earlier can materially improve asset utilization and increase overall return on investment.

On-site power solutions directly affect this schedule.

Fuel Cells

unlock rapid, reliable, on-site power

Consistent Output

Fuel cells maintain high performance across varying load profiles and ambient conditions, critical for AI compute clusters

Modular Architecture

Modules can be added incrementally without redesigning site architecture; expansion aligns with phased commissioning of compute

Faster Time to Power

On-site deployment bypasses extended utility timelines

No-Combustion Advantage

Unlike traditional generators that burn fuel to create electricity through combustion, fuel cells use an electrochemical process to convert natural gas directly into power

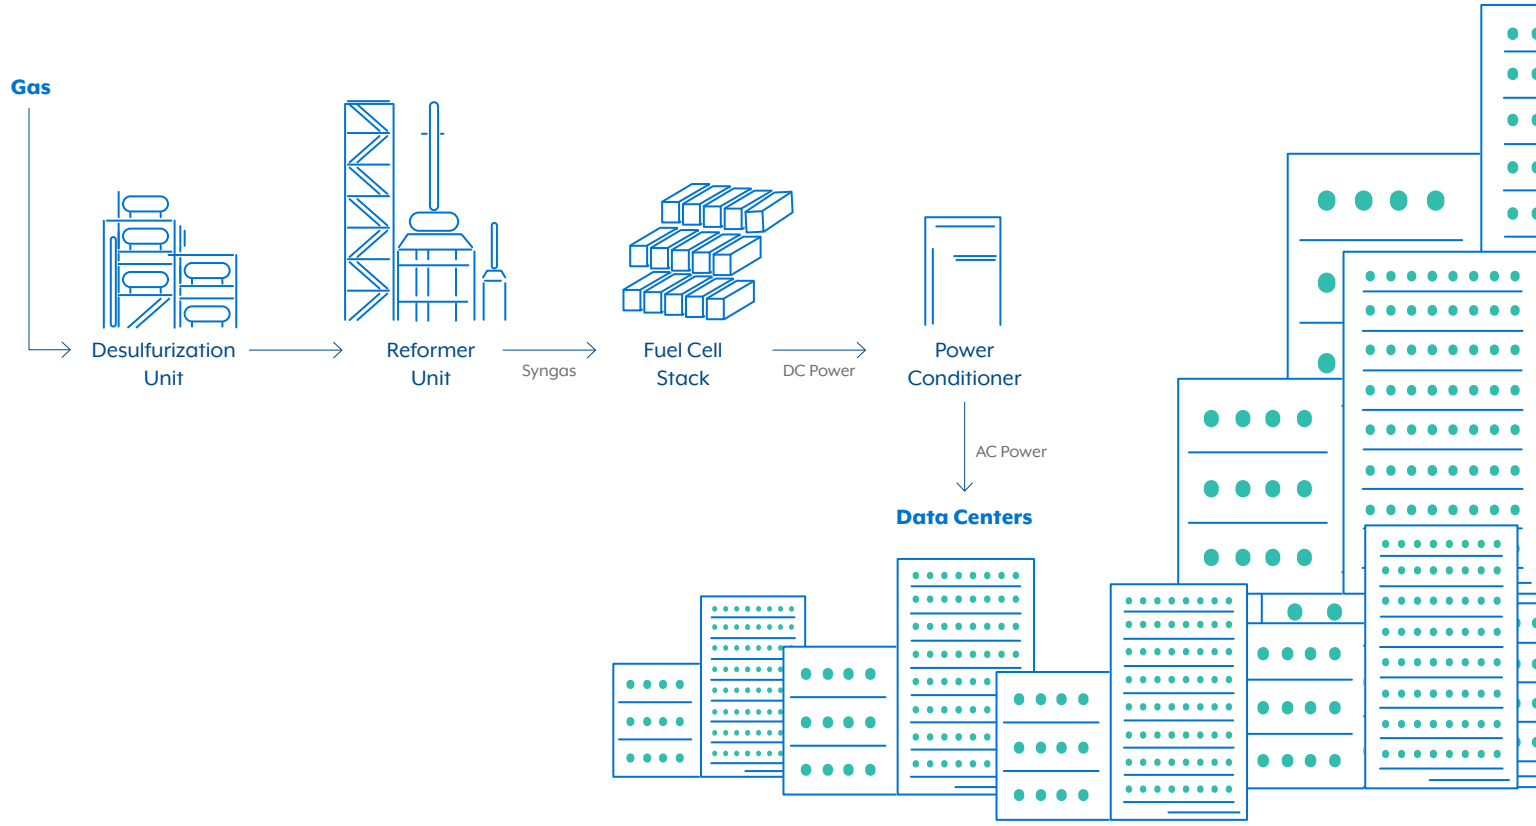

Hydrogen-Ready Pathway

Fuel-cell platforms support low-carbon fuels

KBR's Fuel Cell solution for Data Centers

KBR delivers on-site power using a non-combustion electrochemical process that converts natural gas into reliable power. This enables data-center operators to bring new compute capacity online without waiting for utility timelines.

Systems can be installed and operational in as little as three months. We bring decades of experience in critical modules delivery to deploy these fuel-cell power systems.

We deliver them in **modules.**

Onsite power generation

Upto **"5 nines"** (99.999%) uptime achievable

Deployment within **6 months**

Scalable in multiples of **MW**

Over 20 years of **global** modular delivery experience

>1603
Modules Delivered

18,740 MT
Modules Erected

2,600 MT
Largest and Heaviest Module

Quality, Schedule and Cost Certainty

Repeatable modular workflows, transparent tracking, and minimal field rework, leading to predictable cost profiles and faster delivery.

Technical Feasibility Review

Assessment of site, load and schedule requirements

Supplier evaluation

Feasibility checks on module packaging, power systems, and part specs

Modules Delivery

Fuel cell modules delivered, ready for installation

Multi-stage quality inspections

Fabrication under strict KBR oversight

After Sales

Global customer service network

Warranty, repair, and critical parts support

A Total Solution For Reliable Power

KBR ensures reliable, repeatable, modular deployment across AI and hyperscale campuses, working with a global ecosystem of tier-one vendors to ensure on-time delivery and seamless execution.

Contact our team today to assess your site, explore modular fuel-cell deployment options, and model your total cost of power, uptime benefit and carbon impact.
